## Rainforest Alliance Mission

Our mission is to conserve biodiversity and ensure sustainable livelihoods by transforming land-use practices, business practices, and consumer behavior.

## Rainforest Alliance Pesticide Management concept

The new Rainforest Alliance pesticide management concept of the 2017 Rainforest Alliance Sustainable Agriculture Standard is based on a stronger integrated pest management approach, the prohibition of 152 pesticides covered by the WHO/FAO framework of Highly Hazardous Pesticides, and specific risk management requirements for an additional set of 166 active ingredients. In consequence, 320 pesticide active ingredients will be regulated in the 2017 Rainforest Alliance standard.

The standard ensures pesticide risk reduction through several significant changes that raise the bar for Certification in general in health, environmental protection and sustainable crop production. The amount of pesticide applied by certified farms is expected to go down as a result of rigorous implementation of a new IPM criterion, backed up by training for auditors, and opportunities for better technical support. A state-of-the-science risk assessment process connects individual pesticides to tried-and-tested risk mitigation practices, including those that protect human bystanders, pollinators, vertebrate wildlife and aquatic life (see *Rainforest Alliance List of Pesticides for Use with Risk Mitigation*).

The most egregious health and environmental risks will be eliminated by adoption of an extended version of the WHO/FAO Highly Hazardous Pesticide classification to define Rainforest Alliance prohibited substances. The prohibition of pesticides is framed in the following criterion of the 2017 Rainforest Alliance standard:

- **Critical Criterion 3.4:** The use of substances included in the *Rainforest Alliance List of Prohibited Pesticides* is prohibited. Only pesticides that are legally registered in the production country are used. The use of agriculture mineral oils is only allowed, if these contain less than 3% of Dimethyl Sulfoxide (DMSO) residues.

## List of Prohibited Pesticides

The Rainforest Alliance List of Prohibited Pesticides consists of 152 Rainforest Alliance prohibited pesticides:

Rainforest Alliance Prohibited Pesticides are classified as Highly Hazardous Pesticides according to the definition of the FAO/WHO Panel of Experts on Pesticide Management (JMPM) consisting of 152 active

ingredients. The JMPM, in their 2<sup>nd</sup> session in October 2008, recommended that highly hazardous pesticides should be defined as having one or more of the following characteristics:

- a) Pesticide formulations that meet the criteria of classes Ia (extremely hazardous) or Ib (highly hazardous) of the WHO Recommended Classification of Pesticides by Hazard (indicated in the WHO Ia and WHO Ib columns);
- b) Pesticide active ingredients and their formulations that meet the criteria of carcinogenicity Categories 1A and 1B of the Globally Harmonized System on Classification and Labelling of Chemicals (GHS<sup>1</sup>) (indicated in the GHS Cancer 1A 1B column);
- c) Pesticide active ingredients and their formulations that meet the criteria of mutagenicity Categories 1A and 1B of the Globally Harmonized System on Classification and Labelling of Chemicals (GHS) (indicated in the GHS muta 1A 1B column);
- d) Pesticide active ingredients and their formulations that meet the criteria of reproductive toxicity Categories 1A and 1B of the Globally Harmonized System on Classification and Labelling of Chemicals (indicated in the GHS repro 1A 1B column);
- e) Pesticide active ingredients listed by the Stockholm Convention in its Annexes A and B, and those meeting all the criteria in paragraph 1 of Annex D of the Convention (indicated in the Stockholm Convention column);
- f) Pesticide active ingredients and formulations listed by the Rotterdam Convention in its Annex III (indicated in the Rotterdam Convention column);
- g) Pesticides listed under the Montreal Protocol (indicated in the Montreal Protocol column);
- h) Pesticide active ingredients and formulations that have shown a high incidence of severe or irreversible adverse effects on human health or the environment (indicated in the Severe Effects column): Rainforest Alliance has interpreted this WHO/FAO parameter with the reclassification of the current Rainforest Alliance prohibition of paraquat dichloride, as scientific evidence has revealed that this substance poses severe risks to human health. Atrazine has also been included in this list because of scientific evidence of water contamination. Additionally, the three neonicotinoids clothianidin, imidacloprid and thiamethoxam and the phenylpyrazole fipronil have been incorporated in the Rainforest Alliance Prohibited Pesticide List, because they significantly affect bee populations, other pollinators and birds, can persist for years in soils, and can leach into waterways and groundwater, where they have depleted insect abundance and diversity. Rainforest Alliance also included the three active ingredients aluminum phosphide, magnesium phosphide and phosphine in the list, as their use as a fumigant to control rodent populations in storage facilities can lead to death by inhalation.

The List of Prohibited Pesticides also includes a set of 25 active ingredients considered as obsolete<sup>2</sup> substances.

*The Rainforest Alliance List of Prohibited Pesticides will be reviewed annually by Rainforest Alliance's technical experts. Pesticides added to the respective reference lists of the Montreal Protocol, Rotterdam Convention, Stockholm Convention, WHO (Class Ia or Ib), or GHS (carcinogenicity 1A/1B, mutagenicity 1A/1B, reproductive toxicity 1A/1B) will be included into a revised version of this list. New evidence of substances causing high incidence of severe or irreversible harm to human health or the environment will also be considered. Newly added substances will be subject to a phase-out period for certified farms or group administrators.*

Many pesticides are considered highly hazardous, because of acute toxicity and chronic effects, even at low exposure levels. These pesticides pose unacceptable risks in developing countries because risk reduction

---

<sup>1</sup> According to: Regulation (EC) No 1272/2008 of the European Parliament and of the Council of 16 December 2008 on classification, labelling and packaging of substances and mixtures

<sup>2</sup> Obsolete pesticides are pesticides that are unfit for further use or for re-conditioning. Obsolescence may arise because a product has been de-registered locally or banned internationally. (IUPAC International Union of Pure and Applied Chemistry)

measures such as Personal Protective Equipment or maintenance and calibration of application equipment are frequently not readily implemented, or not effective. The following list of 152 Highly Hazardous Pesticides is consistent with Article 7.5 of the FAO Code of Conduct, which relates to the prohibition of substances that, based on risk assessment, pose unacceptable risks after risk mitigation and marketing measures have been considered.

## List of Pesticides for Use with Risk Mitigation

The 2017 Rainforest Alliance *List of Pesticides for Use with Risk Mitigation* specifies risk associated with, and requirements to mitigate the risks of 166 pesticides (listed in the table below) to human workers/bystanders, aquatic life, wildlife and pollinators.

The analysis of these 166 substances is based on the Oregon State University Integrated Plant Protection Center's state-of-the-science risk assessment tool ipmPRiME and a risk model that identifies moderate to high (10% or greater) risk:

1. Risk to aquatic life subject to the mitigation criterion 3.27:

Pesticides qualified for this risk category if one or more ipmPRiME aquatic risk models (aquatic algae, aquatic invertebrates, or fish chronic risk) exhibited high risk at a typical application rate.

2. Risk to wildlife subject to the mitigation criterion 3.27:

Pesticides qualified for this risk category if one or more ipmPRiME terrestrial risk models (avian reproductive, avian acute, or small mammal risk) exhibited high risk at a typical application rate.

3. Risk to pollinators subject to the mitigation criterion 3.29:

Pesticides were selected based on a widely-used hazard quotient (HQ) resulting of pesticide application rate (AR) in g a.i./ha, and contact LD50 for the honey bee (*Apis mellifera*). Values of HQ<50 have been validated as low risk in the European Union, and monitoring indicates that products with an HQ>2,500 are associated with a high risk of hive loss. The HQ value used by Rainforest Alliance is >350, corresponding to a 15% risk of hive loss. The quotient includes a correction for systemic pesticides, where risks to bees are amplified.

4. Inhalation risk subject to the mitigation requirements listed in critical criterion 4.15:

Inhalation risk to bystanders was calculated using the ipmPRiME model for inhalation toxicity (Jepson et al., 2014<sup>3</sup>) calculated on the basis of child exposure and susceptibility. This index is protective for workers who may enter fields during or after application, and also bystanders.

*The Rainforest Alliance List of Pesticides for Use with Risk Mitigation will be reviewed annually by Rainforest Alliance's technical experts. Pesticides added to the respective reference lists of the Oregon State University's Integrated Plant Protection Center will be included within a revised version of this list.*
